BRIEF REPORT

Dinosaur tracks in the Struganik Quarry (western Serbia)

ANTONELLA CAMMAROSANO1

On the way by the village Struganik, Paola de Capoa1 and Rajka Radoičić2 stopped for a closer look at some Senonian limestones in the Struganik Quarry. Eye-catching in the largest surface of a layer with various trace fossils were some tracks taken to be of a dinosaur. Mrs de Capoa lent me the photographs taken of the tracks for identification, which could be Sauripod tracks (Figs. 1–2). Trace fossils on the same surface (Fig. 3).
