In this paper, we consider the linear telegraph equations with local fractional derivative. The local fractional Laplace series expansion method is used to handle the local fractional telegraph equation. The analytical solution with the non-differentiable graphs is discussed in detail. The proposed method is efficient and accurate.

Key words: telegraph equation, analytical solution, local fractional derivative, water wave, local fractional Laplace series expansion method

Introduction

Local fractional calculus [1] has played an important role in the field of mathematical science and mathematical physics, such as the generalized convex [2] and s-convex [3, 4] functions on fractal sets, and Pompeiu-type [5], Steffensen [6], Hermite-Hadamard [7], Holder [8], Hilbert [9], Korteweg-de Vries [10], Burgers [11], Boussinesq [12], heat conduction [13], diffusion [14, 15], tricomi [16], Goursat [17], and others [18-21].

The many non-differentiable problems were described by the local fractional ODE and PDE. Many computational techniques, such as the non-differentiable travelling-wave transformation technology [10-12], local fractional variational iteration Laplace transform method [13], decomposition method [14], series expansion sumudu transform method [15], local fractional integral transform method [19], and Laplace series expansion method [22-25], were developed to find the solutions for the local fractional ODE and PDE.

The local fractional linear telegraph equations were solved by the Laplace decomposition method [26] and Laplace variational iteration method [27]. The local fractional Laplace series expansion method has not yet been considered to handle the local fractional linear telegraph equation. In the sprint of the idea, the main target of the paper is to present a new application of the local fractional Laplace series expansion method to find the analytic solution of the local fractional linear telegraph equation.
Mathematical fundamentals

In this section, we introduce the concepts of the local fractional derivative and integral and present the local fractional Laplace type transform method.

The local fractional derivative operator of $\Omega(t)$ is defined \([1-27]\):

$$\Omega^{(\alpha)}(t_0) = \frac{d^\alpha \Omega(t)}{dt^{\alpha}} \bigg|_{t=t_0} = \lim_{t\to t_0} \frac{\Delta^\alpha \left[ \Omega(t) - \Omega(t_0) \right]}{(t-t_0)^\alpha} \tag{1}$$

where $\Delta^\alpha [\Omega(t) - \Omega(t_0)] \equiv \Gamma(1+\alpha) \Delta [\Omega(t) - \Omega(t_0)]$.

The properties of the local fractional derivative operator \([1]\) are listed in tab. 1.

As the inverse operator of eq. (1), the local fractional integral operator of $\theta(t)$ is defined \([1, 10, 25]\):

$$\theta(t) = \int_a^b \theta(t) \, \frac{dt}{(1+\alpha) \Gamma(1+\alpha)} = \lim_{s\to 0} \sum_{j=0}^{N-1} \theta(t) \, (\Delta t)^\alpha \tag{2}$$

where $\Delta t = t_{j+1} - t_j$, $j = 0, ..., N - 1$, $t_0 = a$, and $t_N = b$.

The local fractional Laplace type transform operator of $\Omega(t)$ is defined \([1]\):

$$\tilde{Y}_a \{ \Omega(t) \} = \Omega_y^{(\alpha)}(y) = \frac{1}{\Gamma(1+\alpha)} \int_a^\infty E_\alpha \left( \frac{-y^\alpha t^\alpha}{\alpha} \right) \Omega(t) \, (dr)^\alpha, \quad 0 < \alpha \leq 1 \tag{3}$$

The inverse local fractional Laplace type transform operator is defined \([1]\):

$$\Omega(t) = \tilde{Y}_a^{-1} \{ \Omega_y^{(\alpha)}(y) \} = \frac{\Gamma(1+\alpha)}{(2\pi)^\alpha} \int_{\mu-i\infty}^{\mu+i\infty} E_\alpha \left( y^\alpha t^\alpha \right) \Omega_y^{(\alpha)}(y) \, (dy)^\alpha \tag{4}$$

where $y^\alpha = \mu^\alpha + i^{\alpha} c^\alpha$ and $\text{Re}(y^\alpha) = \mu^\alpha$.

Some properties of the local fractional Laplace type transform operator \([1]\) are:

$$\tilde{Y}_a \left\{ \Omega(t) + \Omega_2(t) \right\} = \tilde{Y}_a \left\{ \Omega_1(t) \right\} + \tilde{Y}_a \left\{ \Omega_2(t) \right\} \tag{5}$$

$$\tilde{Y}_a \left\{ \Omega^{(n\alpha)}(t) \right\} = y^{n\alpha} \tilde{Y}_a \left\{ \Omega(t) \right\} - \sum_{k=1}^{n} \frac{y^{(k-1)\alpha}}{n!} \Omega^{(n-k\alpha)}(0) \tag{6}$$
\[ \tilde{Y}_\alpha \left\{ E_\alpha \left( t^\alpha \right) \right\} = \frac{1}{y^{\alpha} - 1} \quad (7) \]

\[ \tilde{Y}_\alpha \left\{ \frac{t^{\alpha i}}{\Gamma(1 + k\alpha)} \right\} = \frac{1}{y^{(1 + i)\alpha}} \quad (8) \]

When \( c \) is a constant, the properties of the local fractional Laplace type transform operator [1] are listed in tab. 3.

**The computational technique applied**

In this section, we introduce the basic ideas of the local fractional series expansion and Laplace series expansion methods.

**The series expansion method**

Following the idea in [8], we consider the local fractional PDE in the operator form:

\[ \phi^{(n\alpha)} = \Pi_\alpha \phi \quad (9) \]

where \( \phi^{(n\alpha)} = \partial^{n\alpha} \phi(x,t) / \partial t^{n\alpha} \) and \( \Pi_\alpha \) is a linear local operator with respect to \( x \).

Let us consider:

\[ \phi(x,t) = \sum_{i=0}^{\infty} \Lambda_i(t) \omega_i(t) \quad (10) \]

where \( \Lambda_i(t) \) and \( \omega_i(x) \) are the non-differentiable functions.

Suppose that \( \Lambda_i(t) = t^{\alpha i} / \Gamma(1 + \alpha i) \), then we have:

\[ \phi(x,t) = \sum_{i=0}^{\infty} \frac{t^{\alpha i}}{\Gamma(1 + i\alpha)} \omega_i(x) \quad (11) \]

such that

\[ \sum_{i=0}^{\infty} \frac{t^{\alpha i}}{\Gamma(1 + i\alpha)} \omega_{i+n}(x) = \sum_{i=0}^{\infty} \frac{t^{\alpha i}}{\Gamma(1 + i\alpha)} (\Pi_\alpha \omega_i)(x) \quad (12) \]

From eq. (12) we have:

\[ \omega_{i+n}(x) = (\Pi_\alpha \omega_i)(x) \quad (13) \]

with the initial condition:

\[ \omega_0(x) = \phi(x,0) \quad (14) \]

Finally, after determining the terms of \( \omega_i(x) \), we obtain the solution of eq. (10) in the series form:

\[ \phi(x,t) = \sum_{i=0}^{\infty} \frac{t^{\alpha i}}{\Gamma(1 + i\alpha)} \omega_i(x) \quad (15) \]

The local fractional Laplace series expansion method

With the aid of the idea of the local fractional Laplace series expansion method [8], considering:

$$\Lambda_i(t) = \frac{t^{ia}}{\Gamma(1 + ia)}$$  \hspace{1cm} (16)

and

$$\phi(x, t) = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_i(x)$$  \hspace{1cm} (17)

we can write eq. (9):

$$\sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_{i+1}(x) = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} (\Pi_i \phi_i)(x)$$  \hspace{1cm} (18)

which leads to:

$$\phi_{i+1}(y) = (\Pi_i \phi_i)(y)$$  \hspace{1cm} (19)

where

$$\tilde{Y}_a \{\phi(x, t)\} = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_i(y)$$  \hspace{1cm} (20)

$$\tilde{Y}_a \{(\phi^{(m)})(x, t)\} = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_{i+1}(y) = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_{i+1}(y)$$  \hspace{1cm} (21)

$$\tilde{Y}_a \{(\Pi_i \phi)(x, t)\} = \Pi_i \left[ \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_i(y) \right] = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} (\Pi_i \phi)(y)$$  \hspace{1cm} (22)

Thus, we have the following iteration equation:

$$\begin{align*}
\omega_{i+2}(y) &= (\Pi_i \omega_i)(y) \\
\omega_{i+1}(y) &= \tilde{Y}_a \{\phi_i(x, 0)\} = \phi_i(y, 0) \\
\omega_i(y) &= \tilde{Y}_a \{\phi_i(x, 0)\} = \phi_i(y, 0)
\end{align*}$$ \hspace{1cm} (23)

and so on, where $\phi(x, 0)$ are the initial value conditions.

Thus, we have:

$$\phi(y, t) = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \phi_i(y)$$  \hspace{1cm} (24)

which deduces that:

$$\phi(x, t) = \tilde{Y}_a^{-1} \{\phi(y, t)\} = \sum_{i=0}^{\infty} \frac{t^{ia}}{\Gamma(1 + ia)} \tilde{Y}_a^{-1} \{\omega_i(y)\}$$  \hspace{1cm} (25)

Solving the local fractional telegraph equation

Let us consider the local fractional telegraph equation [26]:

\begin{align*}
\text{Li, J., et al.: A Non-Differentiable Solution for the Local Fractional Telegraph Equation} \\
\text{THERMAL SCIENCE: Year 2017, Vol. 21, Suppl. 1, pp. S225-S231} \\
\text{The local fractional Laplace series expansion method} \\
\text{With the aid of the idea of the local fractional Laplace series expansion method [8], considering:} \\
\text{(16) and} \\
\text{(17) we can write eq. (9):} \\
\text{(18) which leads to:} \\
\text{(19) where} \\
\text{(20) and (21) lead to:} \\
\text{(22) thus, we have the following iteration equation:} \\
\text{(23) and so on, where $\phi(x, 0)$ are the initial value conditions.} \\
\text{Thus, we have:} \\
\text{(24) which deduces that:} \\
\text{(25) Solving the local fractional telegraph equation} \\
\text{Let us consider the local fractional telegraph equation [26]:} \\
\end{align*}
\[
\frac{\partial^{2\alpha}\phi(x,t)}{\partial t^{2\alpha}} = \frac{\partial^{2\alpha}\phi(x,t)}{\partial x^{2\alpha}} + \frac{\partial^{\alpha}\phi(x,t)}{\partial x^{\alpha}} - \phi(x,t)
\]  
(26)

subject to the initial conditions:
\[
\phi(0, x) = E_a(-x^\alpha)
\]  
(27)
\[
\frac{\partial^{\alpha}\phi(0, x)}{\partial t^{\alpha}} = E_a(-x^\alpha)
\]  
(28)

With the help of the idea of the local fractional Laplace series expansion method, we structure:
\[
\omega_{\alpha,2}(x) = (\Pi_{\alpha,0})(x)
\]  
(29)

where
\[
(\Pi_{\alpha,\omega})(x) = \frac{d^{2\alpha}\omega(x)}{dx^{2\alpha}} + \frac{\partial^{\alpha}\omega(x)}{\partial x^{\alpha}} + \beta\omega(x)
\]  
(30)

which leads to:
\[
\omega_{\alpha,2}(y) = (\Lambda^\omega)(y)
\]  
(31)

where
\[
(\Lambda^\omega)(y) = \bar{Y}_{\alpha}\left\{\frac{d^{2\alpha}\omega(y)}{dx^{2\alpha}} + \frac{\partial^{\alpha}\omega(y)}{\partial x^{\alpha}} + \beta\omega(y)\right\}
\]  
(32)
\[
\omega_{\alpha}(y) = \frac{1}{y^{\alpha} + 1}
\]  
(33)
\[
\omega_{\beta}(y) = \frac{1}{y^{\alpha} + 1}
\]  
(34)

Thus, finally, we have:
\[
\phi(x, t) = E_a(-x^\alpha)\left[\sin_{\alpha}\left(t^\alpha\right) + \cos_{\alpha}\left(t^\alpha\right)\right]
\]  
(35)

which is in agreement with the result obtained in [26].

**Conclusion**

In the present work, the local fractional Laplace series expansion method was implemented to present the non-differentiable solution for the local fractional telegraph equation. The method is accurate and efficient.
